Using the Exchange Supplies pipe

1

Push the gauze into the end of the pipe, a few millimetres from the end.

Attach mouthpiece.

Place the drug on the gauze (use different pipes for different drugs).

Carefully hold the pipe sloping upwards so the drug doesn't fall out.

Exhale, bring pipe to the lips.

Light a lighter on a medium flame, and bring it to the end of the pipe and inhale.

The end of the flame will touch the gauze as you inhale.

Slowly rotate the pipe as you heat.

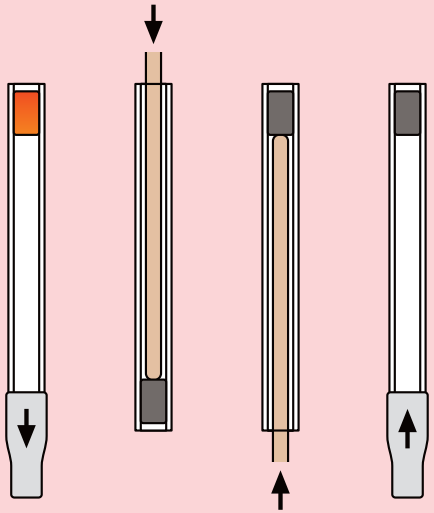

When your lungs are nearly full, remove heat, and keep inhaling until the drug stops vaporising.

Breathe out.

Collecting crack residue ('recycle')

When the gauze and pipe are hot, immediately after exhaling, remove the mouthpiece and use the chopstick to push the gauze down and back up.

The hot gauze will scrape crack recycle off the inside of the pipe, and you can then smoke it.

If you let the gauze cool too much, it can get stuck.
